

Guide:

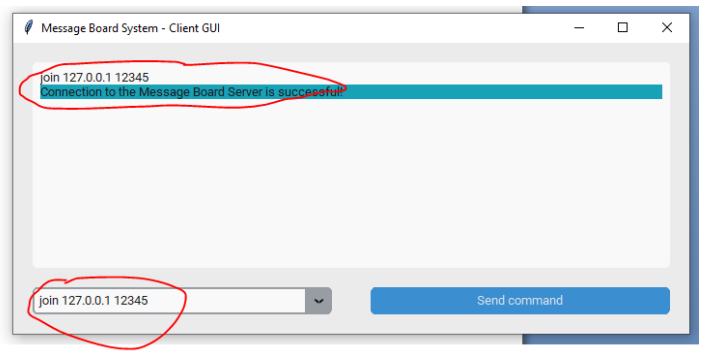

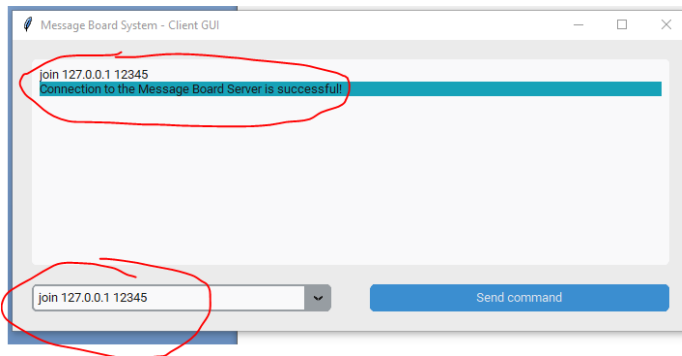

1. After installing customtkinter, open the command prompts and run the programs (server.py must be run first before clientGUI.py)

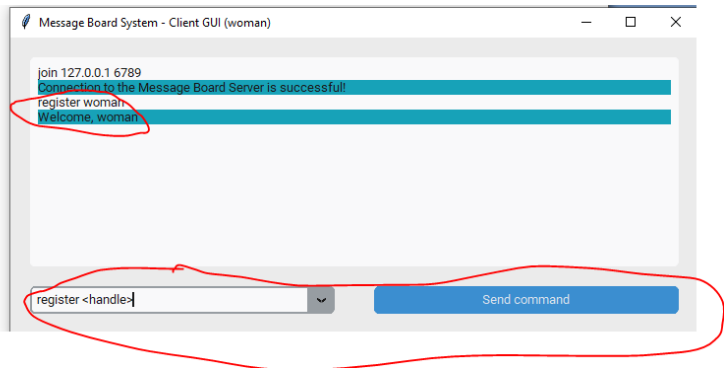

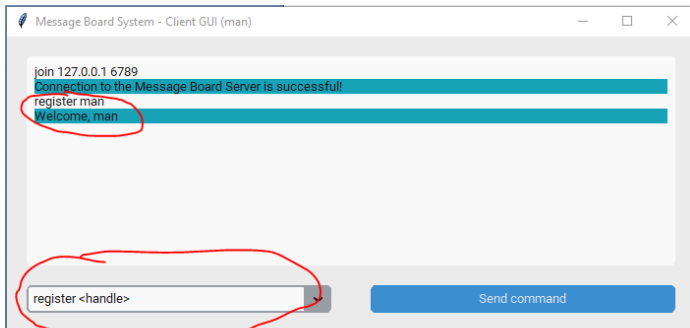

2. A GUI will appear for every clientGUI.py that was run. The GUIs have a drop-down box on the lower left that has the commands. They can be overwitten by the user if they want to. Note: do not touch the center text box or that will mess with the formatting of the output.

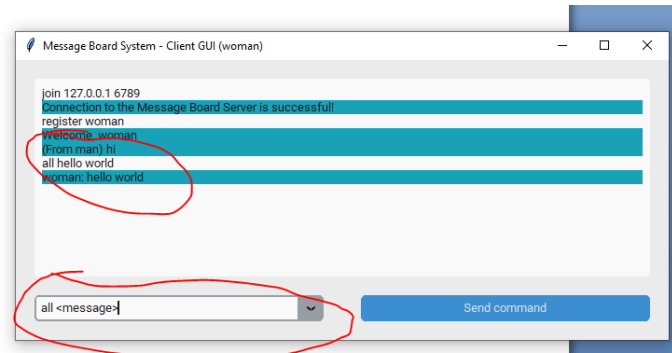

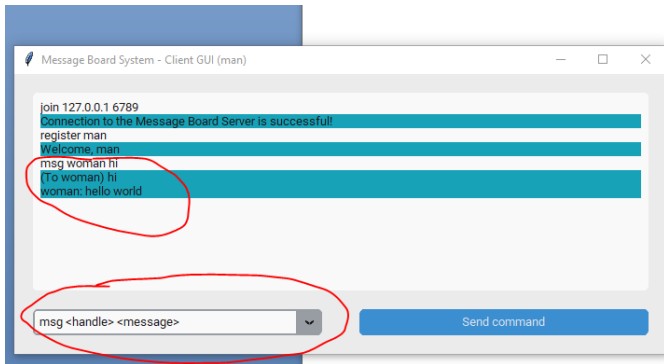

3. Join the server using the command “join 127.0.0.1 12345”

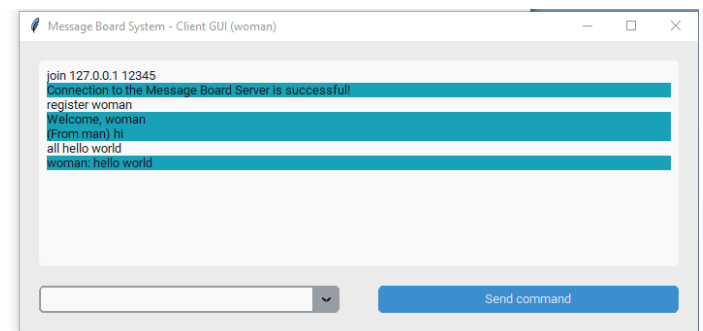

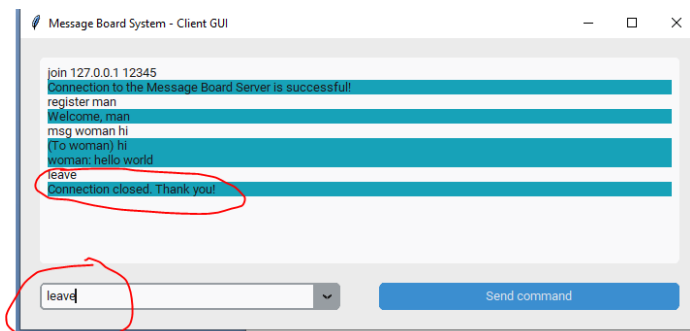

4. Register handles/aliases

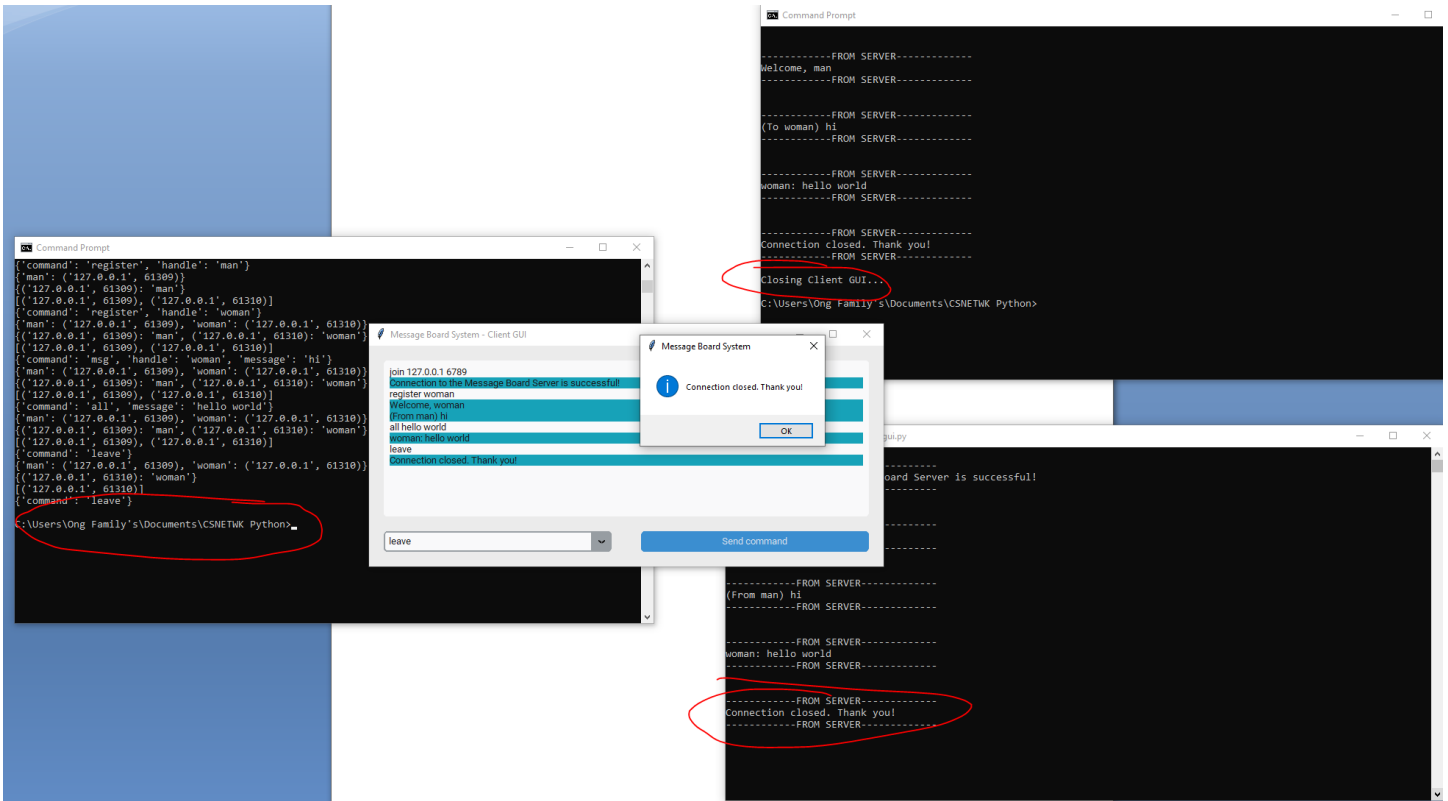

5. Start messaging

6. Leave (the server.py will continue to run so long as at least one other clientGUI.py is joined)

- Close all clients by clicking the “x” button (server.py will terminate when no clientGUI.py programs are connected to the server)

- Done (programs can be run again)
